Legal Notices

We offer information as a service to you. The provided information is based on your requirements and we make every effort to ensure its quality. You agree that you are responsible for using independent analysis and evaluation in designing intended products, and we provide reference designs for illustrative purposes only. Before using any hardware, software or service guided by this document, please read this notice carefully. Even though we employ commercially reasonable efforts to provide the best possible experience, you hereby acknowledge and agree that this document and related services hereunder are provided to you on an “as available” basis. We may revise or restate this document from time to time at our sole discretion without any prior notice to you.

Use and Disclosure Restrictions

License Agreements

Documents and information provided by us shall be kept confidential, unless specific permission is granted. They shall not be accessed or used for any purpose except as expressly provided herein.

Copyright

Our and third-party products hereunder may contain copyrighted material. Such copyrighted material shall not be copied, reproduced, distributed, merged, published, translated, or modified without prior written consent. We and the third party have exclusive rights over copyrighted material. No license shall be granted or conveyed under any patents, copyrights, trademarks, or service mark rights. To avoid ambiguities, purchasing in any form cannot be deemed as granting a license other than the normal non-exclusive, royalty-free license to use the material. We reserve the right to take legal action for noncompliance with abovementioned requirements, unauthorized use, or other illegal or malicious use of the material.

Trademarks

Except as otherwise set forth herein, nothing in this document shall be construed as conferring any rights to use any trademark, trade name or name, abbreviation, or counterfeit product thereof owned by Quectel or any third party in advertising, publicity, or other aspects.

Third-Party Rights

This document may refer to hardware, software and/or documentation owned by one or more third parties (“third-party materials”). Use of such third-party materials shall be governed by all restrictions and obligations applicable thereto.

We make no warranty or representation, either express or implied, regarding the third-party materials, including but not limited to any implied or statutory, warranties of merchantability or fitness for a particular purpose, quiet enjoyment, system integration, information accuracy, and non-infringement of any third-party intellectual property rights with regard to the licensed technology or use thereof. Nothing herein constitutes a representation or warranty by us to either develop, enhance, modify, distribute, market, sell, offer for sale, or otherwise maintain production of any our products or any other hardware, software, device, tool, information, or product. We moreover disclaim any and all warranties arising from the course of dealing or usage of trade.

Disclaimer

- a) We acknowledge no liability for any injury or damage arising from the reliance upon the information.
- b) We shall bear no liability resulting from any inaccuracies or omissions, or from the use of the information contained herein.
- c) While we have made every effort to ensure that the functions and features under development are free from errors, it is possible that they could contain errors, inaccuracies, and omissions. Unless otherwise provided by valid agreement, we make no warranties of any kind, either implied or express, and exclude all liability for any loss or damage suffered in connection with the use of features and functions under development, to the maximum extent permitted by law, regardless of whether such loss or damage may have been foreseeable.
- d) We are not responsible for the accessibility, safety, accuracy, availability, legality, or completeness of information, advertising, commercial offers, products, services, and materials on third-party websites and third-party resources.

1 Introduction

This document describes the process of Quectel modules' secondary SMT and desoldering. It is applicable to all Quectel modules in LCC or LGA form factor.

NOTE

This document may be updated at any time in accordance with updates of Quectel products or for other reasons. The contents of this document are for your reference only considering the varying factors in production, such as the different designs and structures of the products and the varying production environment and equipment. The production may not be guaranteed only by following the statements, descriptions and suggestions in this document.

2 Information about Modules

2.1. Surface-Mount Packaging Type

Quectel modules adopt LCC and/or LGA package.

2.2. Packing Methods

Quectel provides vacuum tape and reel pack as shown by the following figure.

Vacuum Pack

Tape & Reel Packing Inside the Vacuum Pack

Figure 1: Vacuum Tape & Reel Pack

3 Requirements for SMT

3.1. Chip Mounter

- Feeder: support auto tray feeder and auto reel feeder.
- Image processing: optical plummet centering.
- Diameter of nozzle: select the suitable nozzle according to the module size and keep the module stable during the process.

NOTE

The recommended diameter of nozzle should be no less than 40 % of the module's shorter side. For example, if the module size is 25.0 mm × 20.0 mm, the nozzle diameter should be 8.0 mm at least.

3.2. Soldering Requirements

1. It is recommended to use reflow soldering equipment with eight zones at least. For Quectel LTE, LPWA, Automotive and Smart series modules, reflow soldering equipment with at least ten zones is recommended.
2. In a lead-free reflow oven, the real peak temperature at the temperature measuring point of pads at the bottom of modules should be greater than 238 °C, and the temperature of that with SMT carrier is recommended to be 240 °C to 246 °C to avoid cold solder joints. Further, based on material's heat absorption and size of the carrier, the period in which temperature is over 217 °C should be extended by up to 10 seconds.
3. If thickness of the motherboard is less than 1.0 mm, it is recommended to use carriers when soldering to prevent distortion of the motherboard.

4. For the finishing of pads on the PCB, it is recommended to use the same finishing technique as the module's pin, that is, ENEG (Electroless Nickel Electroless Gold) or ENIG (Electroless Nickel Immersion Gold). And HASL (Hot-Air Solder Leveling) is not recommended.

4 Attentions for Manufacturing

4.1. MSL and Moisture-proof Requirement

Quectel SMD module is sensitive to moisture. According to IPC-JEDEC standard, the moisture sensitive level (MSL) of Quectel SMD modules is rated as “3”. Please make sure the vacuum package is intact before using. After opening the package, please confirm the status of humidity indicator card in the vacuum-sealed package. To prevent the module from permanent damage, baking before reflow soldering is required if circumstance below occurs:

- Humidity indicator card: At least one circular indicator is no longer blue (turned to pink).

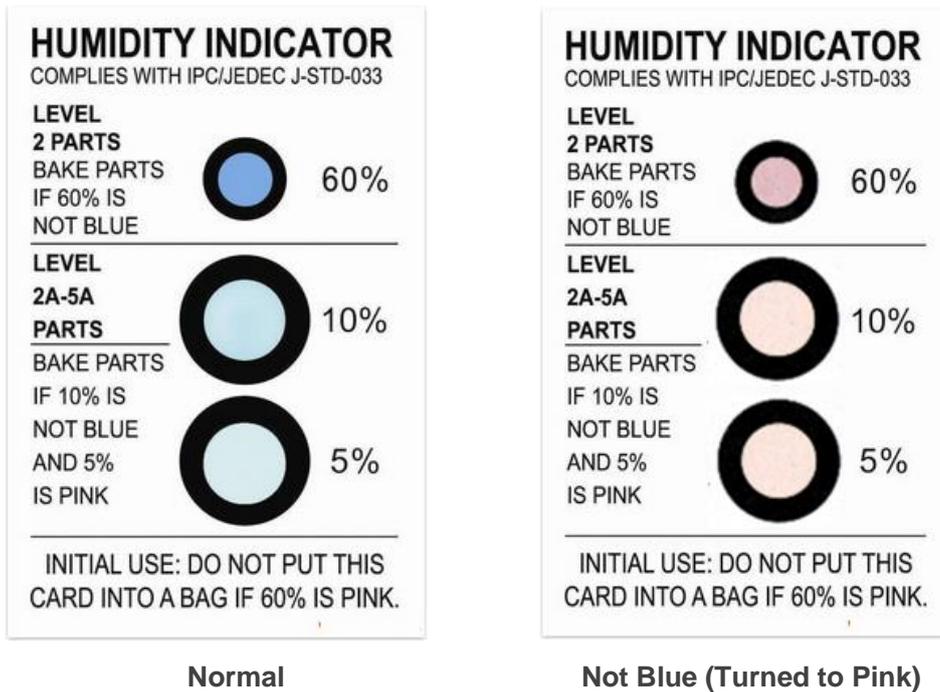

Figure 2: Humidity Indicator Card

4.2. Storage

- **Recommended Storage Condition:**
The temperature should be 23 °C ±5 °C and the relative humidity should be 35–60 %.
- **Storage Life (in Sealed Vacuum Package):**
12 months in Recommended Storage Condition.

4.3. Floor Life and Temperature&Moisture Control

Floor life refers to the allowable time period between removal of the module from a package, dry storage, or dry bake and the solder reflow process. Floor life of MSL-3 products should be 168 hours ¹⁾. In a plant where the temperature is 23 ±5 °C and relative humidity is below 60%, the module must be processed in solder reflow or other high-temperature operations within 168 hours after the package is removed. Otherwise, the module should be stored in environment where the relative humidity is less than 10 %, such as a dry cabinet.

NOTE

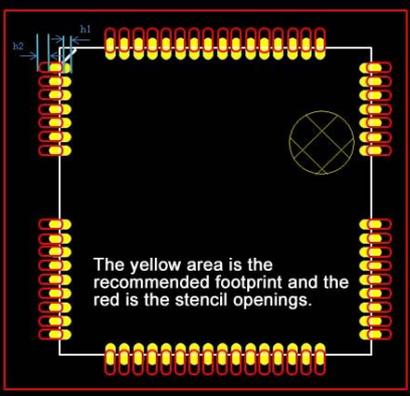

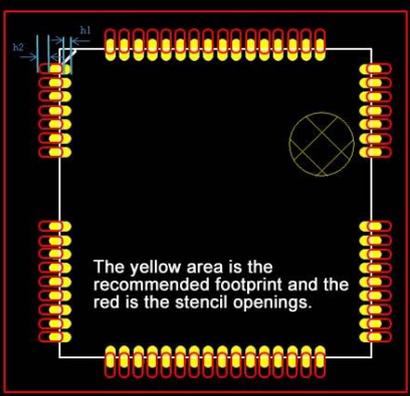

1. ¹⁾ This floor life is only applicable when the environment conforms to *IPC/JEDEC J-STD-033*. It is recommended to start the solder reflow process **within 24 hours** after the package is removed if the temperature and moisture do not conform to, or are not sure to conform to *IPC/JEDEC J-STD-033*. And do not remove the packages of tremendous modules if they are not ready for soldering.
2. To avoid blistering, layer separation and other soldering issues, it is forbidden to expose the modules to the air for a long time.
3. In case of broken vacuum package, violation of moisture-proof requirement, materials in bulk, or expired one-year validity period, the module should be pre-baked before being put on the production line or repaired. In such case, the module should be pre-baked for 24 hours at 120 °C ±5 °C to avoid blistering, crack and layer separation.
4. Please take out the module from the package and put it on high-temperature resistant fixtures before baking (it is forbidden to bake the module with plastic trays or packaging reels directly). All modules must be soldered to PCB within 24 hours after the baking, otherwise put them in the drying oven. Please pay attention to ESD protection, such as wearing anti-static gloves, when touching the modules.
5. After the baking, trays should be used for the chip mounter following the methods below:
 - Method 1:** Use dedicated trays with matching sizes and place the modules before they are put on the production line;
 - Method 2:** When there is no dedicated tray, use the black electrostatic carrier tape for packaging the modules. Cut the carrier tapes into multiple shorter tapes of the same length, and neatly attach them on the tray of the chip mounter as a simple dedicated tray.

4.4. Stencil Design Requirements

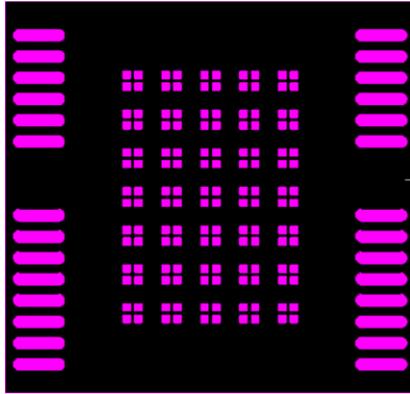

To ensure the solder paste is enough and soldering joints are reliable, the stencil should be partly stepped-up on the top surface. And the stencil aperture for each single pad cannot be larger than 3.0 mm × 4.0 mm and the exceeded part should be divided into smaller apertures with size less than 2.0 mm × 2.0 mm by 0.3–0.5 mm shelves. There is no need of opening for arc-shaped pad near regular pads; if there is any component, a clearance of over 1.0 mm should be left between outward end of the aperture and the component.

The stencil design requirements for Quectel modules are shown in the table below. Diagrams in the table are only typical examples of corresponding modules. Diagrams of different modules listed in the same row may vary but the stencil requirements for them are identical.

Table 1: Stencil Design Requirements

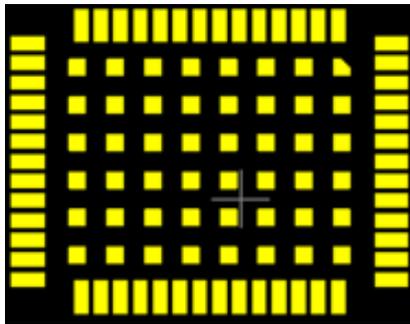

Module	Diagram for Stencil Designs	Requirement Description
M08-R/ M10/ M12/ M72/ M80/ M85/ M95/ M66/ M66- DS/ GC10	 <p>The yellow area is the recommended footprint and the red is the stencil openings.</p>	<ol style="list-style-type: none"> 1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm. 2. The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm (refer to h1 in the left figure) and the outermost edge should be shifted outward by 0.40–0.60 mm (refer to h2 in the left figure). 3. The width should be reduced in a ratio of 1:0.8 or 1:0.9.
L10/ L16/ L20/ L26/ L30/ L50/ L70/ L76/ L80/ L70-R/ L70-RL/ L76-L/ L76B/ L80- R/ L86/ L96/ L89	 <p>The yellow area is the recommended footprint and the red is the stencil openings.</p>	<ol style="list-style-type: none"> 1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm. 2. The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm (refer to h1 in the left figure) and the outermost edge should be shifted outward by 0.40–0.60 mm (refer to h2 in the left figure). 3. The width should be reduced in a ratio of 1:0.8 or 1:0.9.

LC98S

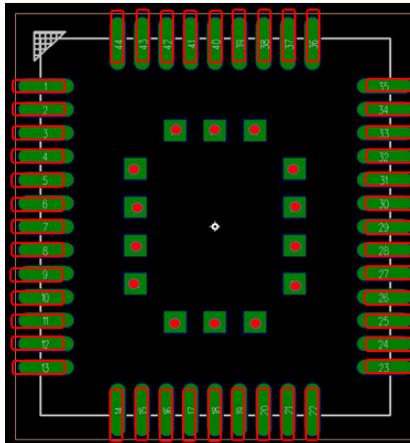

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.18 mm.
2. For pads on both sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.40–0.60 mm. The width should be reduced in a ratio of 1:0.8 or 1:0.9.
3. For the square pads in the center, the aperture should be divided into four smaller squares and centered with area reduced to 60–70 % of that of the corresponding pad.

LG69T

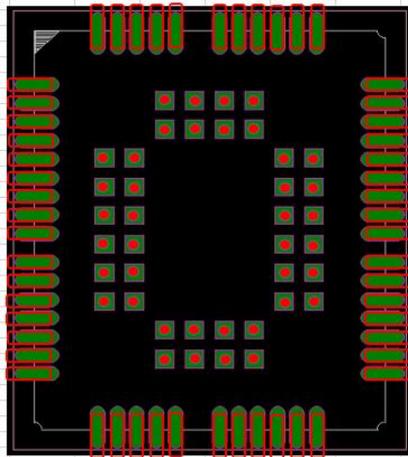

1. The stencil thickness of the area for the module should be partly stepped-up to 0.10–0.12 mm.
2. For pads on four sides:
The aperture length and width should be reduced in a ratio of 1:0.65 or 1:0.7.
3. For the square pads in the center, the aperture should be centered with area reduced to 60–70 % of that of the corresponding pad.

BC66/ BC68

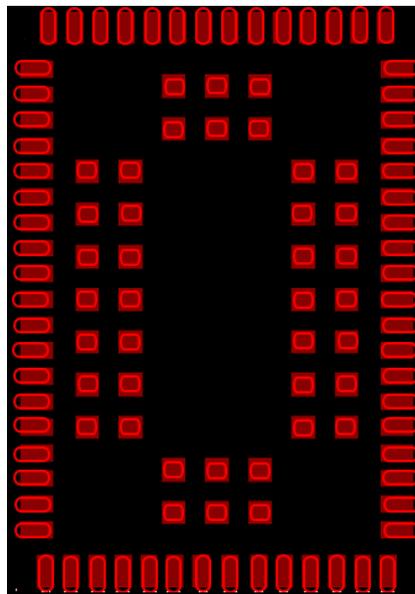

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.40–0.60 mm, and the width should be reduced in a ratio of 1:0.8 or 1:0.9. The shape should be rectangle with round chamfers.
3. For pads in the center:
The stencil aperture area for each single pad should be 50–70 % of that of the corresponding pad and the shape should be round.

BC95-G/ BC92

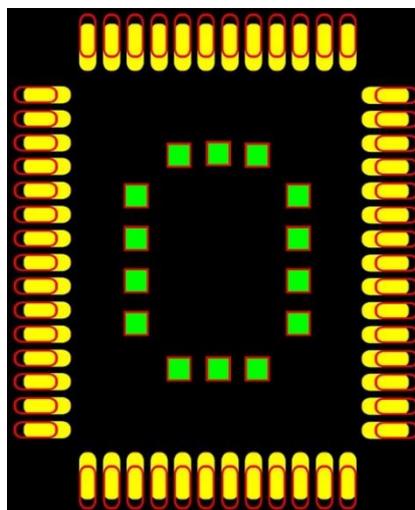

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.40–0.60 mm, and the width should be reduced in a ratio of 1:0.8 or 1:0.9. The shape should be rectangle with round chamfers.
3. For pads in the center:
The stencil aperture area for each single pad should be 50–70 % of that of the corresponding pad and the shape should be round.

M89

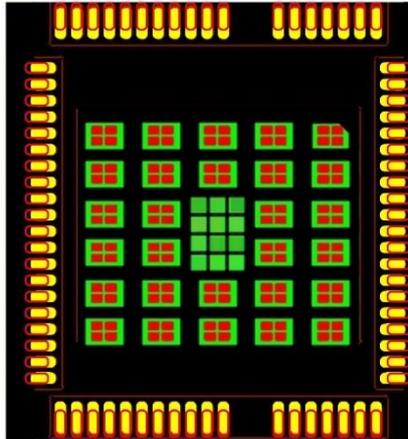

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.40–0.60 mm, and the width should be reduced in a ratio of 1:0.8 or 1:0.9. And the shape should be rectangle with round chamfer.
3. For pads in the center:
The stencil aperture for each single pad should be centered with area reduced to 50–70 %, and should be designed with round chamfers.

MC60/
BC660K-GL

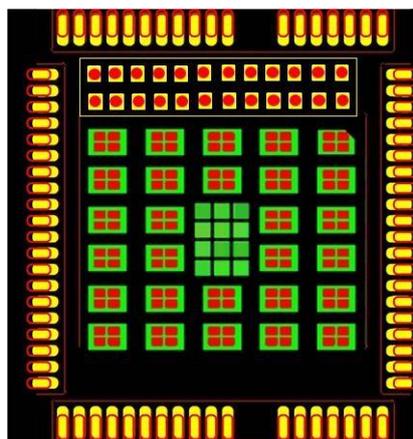

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.40–0.60 mm, while the width should be reduced in a ratio of 1:0.8 or 1:0.9. And the shape should be rectangle with round chamfers.
3. For pads in the center:
The stencil aperture for each pad should be centered with area reduced to 50–75 %. The shape should be square.

UC20/ UC15

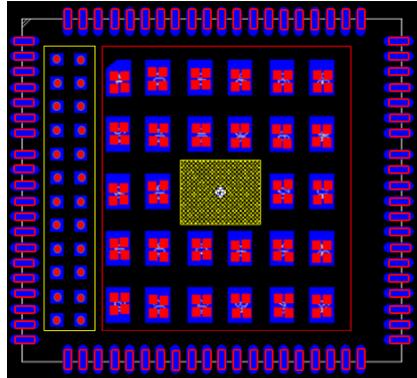

1. The stencil thickness of the area for the module should be partly stepped-up to 0.18–0.20 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.40–0.60 mm. The width should be reduced in a ratio of 1:0.8 or 1:0.9. And the shape should be rectangle with round chamfers.
3. For GND pads in the center:
Design the stencil aperture for each pad into four 1.00 mm × 0.65 mm smaller apertures shaped in 0.05 mm × 0.05 mm square with round chamfers, and with clearance of 0.25 mm in between.
4. For the 12 pins in the very center:
The stencil aperture for each pad should be centered with area reduced to 50–70 %. The shape should be square.

EC20/ EC21/
EC25/ UC200T/
EC200T/ EC200S/
EC200U/ EC200A

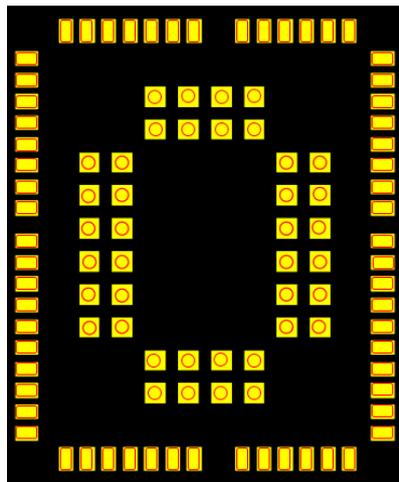

1. The stencil thickness of the area for the module should be partly stepped-up to 0.18–0.20 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.60 mm. The width should be reduced in a ratio of 1:0.8 or 1:0.9. And the shape should be rectangle with round chamfers.
3. For GND pads in the center:
Design the stencil aperture for each pad into four smaller 1.00 mm × 0.65 mm square apertures with 0.05 mm × 0.05 mm round chamfers, and with clearance of 0.25 mm in between.
4. For the pads in the yellow frame, the aperture should be round with 80 % area of each pad.
5. For the 12 pins in the very center:
The stencil aperture for each pad should be centered with area reduced to 50–70 %. The shape should be square.

EG25-G/ EG21-G

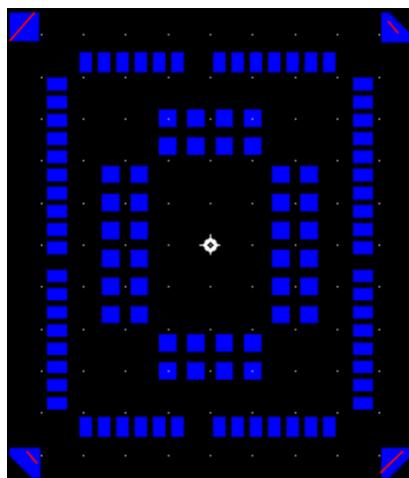

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. For pads on four sides:
The stencil aperture should be centered with area reduced to 65–80 % and the shape should be rectangle with round chamfers.
3. For pads in the center (in the red frame):
Design four square apertures centered in each pad, of which the total area is 60–75 % of that of the pad.
4. The apertures for pads in the yellow frame should be centered with area reduced to 70–80 % and the shape should be rectangle with round chamfers.
5. The yellow block in the very center should be kept intact.

UG95/ UG96/
BG96/ BG95/
BG950A-GL/
BG951A-GL

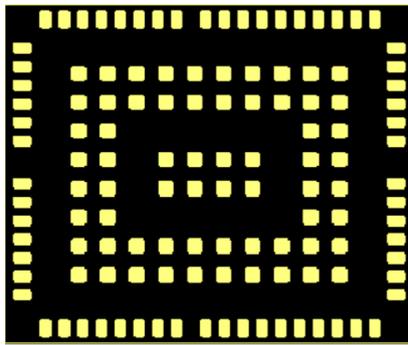

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. For pads on four sides:
The aperture for each single pad should be centered with area reduced to 70–85 %. And the shape should be rectangle with round chamfers.
3. For square pads in the center:
The aperture for each single pad should be designed into round and centered with area reduced to 60–75 %.

EG91/ EG95/
EG912Y

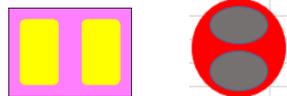

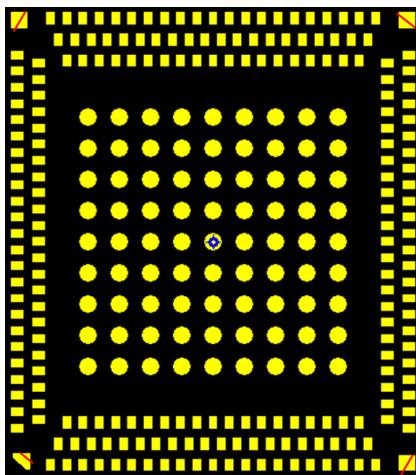

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. For pads on four sides:
The aperture for each single pad should be centered with area reduced to 70–80 %. And the shape should be rectangle with round chamfers.
3. For square pads in the center:
The aperture for each single pad should be designed into round and centered with area reduced to 60–75 %.
4. For pads at four corners:
The stencil aperture should be designed into diagonal-patterned lines with 50–60 % area of the corresponding pad.

EG915U

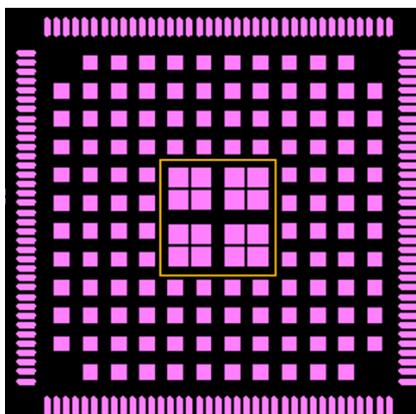

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. For pads on four sides:
The aperture for each single pad should be centered with area reduced to 70–80 %. And the shape should be rectangle with round chamfers.
3. For pads in the middle:
The aperture should be centered with area reduced to 70–80 % of that of the corresponding pad.

EG06/ EG12/
EG18

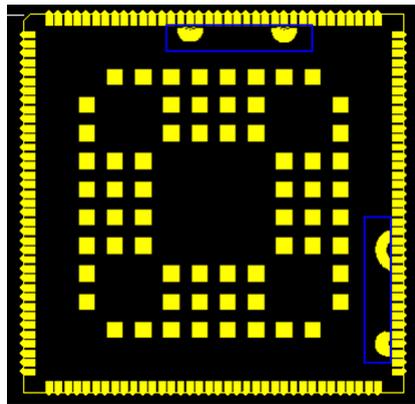

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.18 mm.
2. For pads on four sides:
The aperture for each single pad should be centered with area reduced to 75–90 %. And the shape should be rectangle with round chamfers as shown by the bottom left figure (yellow areas indicate the apertures for each pad, width of the bridge in between is 0.20 mm).
3. For pads at four corners:
The stencil aperture should be designed into diagonal-patterned lines with 50–60 % area of the corresponding pad.
4. For round pads in the center:
The aperture should be designed as shown by the bottom right figure (grey areas refer to the aperture shape, with 60–80 % area of the pad).

SC200R/ SC200E

1. The stencil thickness of the area for the module should be partly stepped-up to 0.18–0.20 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.60–0.80 mm, while width should be reduced in a ratio of 1:0.8 or 1:0.9. And should be shaped into rectangle with round chamfers.
3. For square pads in the center, the stencil aperture should be centered with area reduced to 40–75 % of that of the corresponding pad.

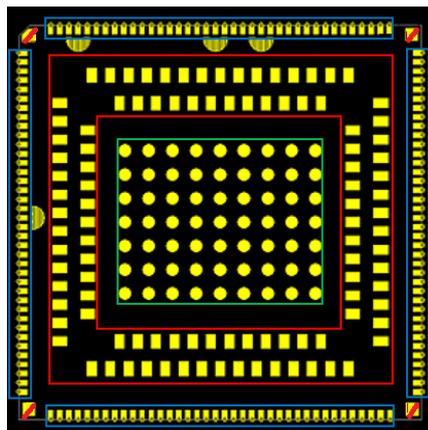

SC20

4. For the bigger square pads in the center (within the yellow frame), the aperture should be divided into four smaller squares and centered with area reduced to 45–65 % of that of the corresponding pad.

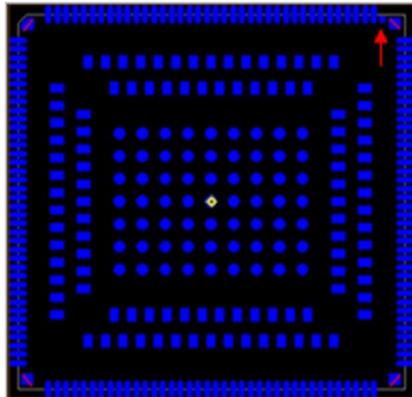

1. The stencil thickness of the area for the module should be partly stepped-up to 0.18–0.20 mm.
2. For pads on four sides: The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.60–0.80 mm, while width should be reduced in a ratio of 1:0.8 or 1:0.9. And should be shaped into rectangle with round chamfers.
3. For square pads in the center, the stencil aperture area should be 50–75 % of that of the corresponding pad.
4. There is no need to design stencil aperture for the arc-shaped pad in the blue frames.

SC600T/ SC600Y

1. The stencil thickness of the area for the module should be partly stepped-up to 0.18–0.20 mm.
2. For pads on four sides (in blue frames), the innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.60–1.00 mm while the width should be reduced in a ratio of 1:0.8 or 1:0.9. And the shape should be rectangle with round chamfers.
3. For square pads between the two red frames, the stencil aperture should be centered with area reduced to 75–90 % and designed with round chamfers.
4. For round pads in the center (in the green frame), the stencil aperture should be centered with area reduced to 50–70 %.
5. For pads at the four corners of the module, the stencil aperture should be designed into diagonal-patterned lines with 50–70 % area of the corresponding pad.
6. There is no need to design stencil aperture for the four arc-shaped pads.

SC66

1. The stencil thickness of the area for the module should be partly stepped-up to 0.18–0.20 mm.
2. For pads on four sides:

The innermost edge of aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.60–0.80 mm, while the width should be reduced in a ratio of 1:0.8 or 1:0.9. And the shape should be rectangle with round chamfers.
3. For square pads in the center:

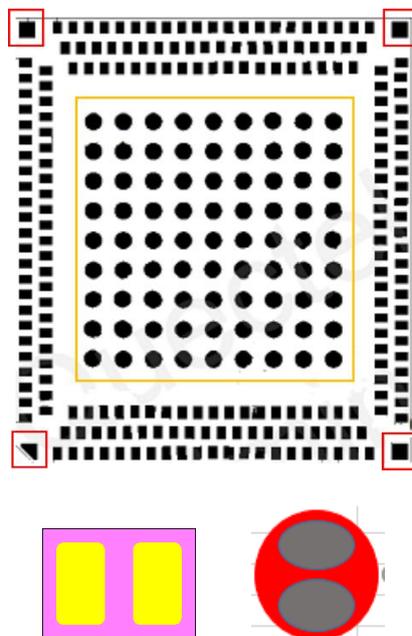

the stencil aperture should be centered with area reduced to 75–90 % and designed with round chamfers.
4. For round pads in the very center:

The aperture should be centered with area reduced to 50–70 %.
5. For pads at four corners:

the stencil aperture should be designed into diagonal-patterned lines with 50–60 % area of the corresponding pad.
6. For the pad marked with red arrow:

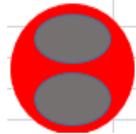

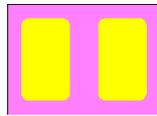

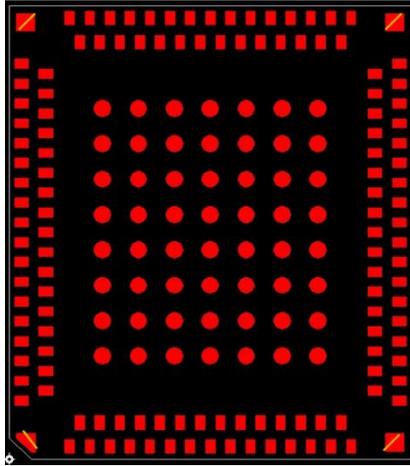

The aperture should be centered with area reduced to 75–90 %.

AG35/
EG060V-EA/
EG065K

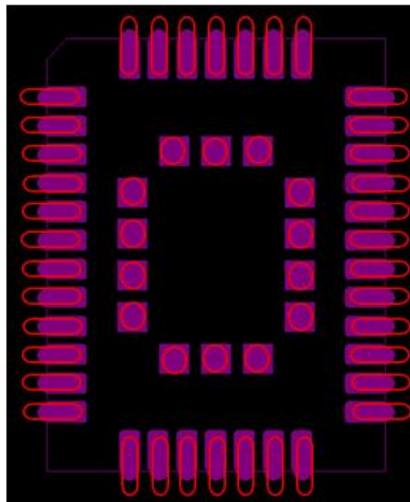

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. The stencil aperture area for the pads on four sides should be centered with 75–90 % area of corresponding pads, and should be designed with round chamfers as shown by the bottom left figure (yellow areas indicate the apertures for each pad, width of the bridge in between is 0.20 mm).
3. For pads at four corners (marked with red frames), the stencil aperture should be reduced inward in the shape of diagonal-patterned lines with 50–60 % area of the corresponding pad.
4. The stencil aperture for round GND pads in the yellow frame should be designed as shown by the bottom right figure (grey areas refer to the aperture shape, with 60–80 % area of the pad).

AG15/
AG215S-CN

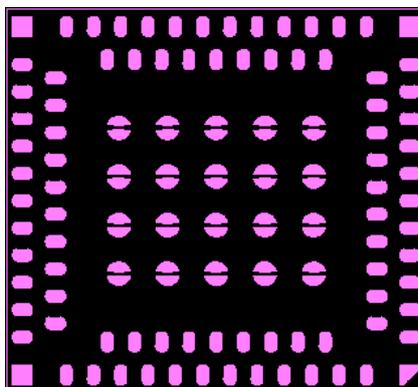

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. The stencil aperture area for the pads on four sides should be centered with 75–90 % area of corresponding pads, and should be designed with round chamfers as shown by the bottom left figure (yellow areas indicate the apertures for each pad, width of the bridge in between is 0.20 mm).
3. For pads at four corners, the aperture should be centered and designed into diagonal-patterned lines with 50–60 % area of the corresponding pad.
4. The aperture for round GND pads in the center should be designed as shown by the bottom right figure (grey areas refer to the aperture shape, with 60–80 % area of the pad).

FC20

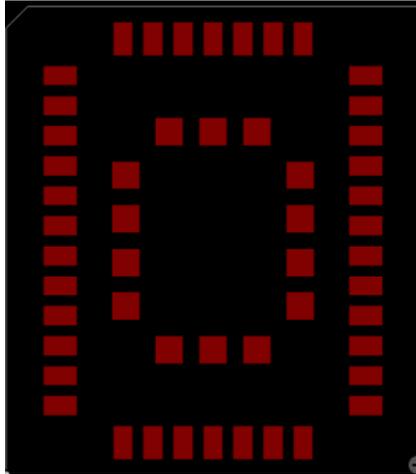

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For pads on four sides:
The innermost edge of the aperture for each single pad should be shifted outward by 0.10–0.20 mm and the outermost edge should be shifted outward by 0.40–0.60 mm while the width should be reduced in a ratio of 1:0.8 or 1:0.9, and should be designed in rectangle with round chamfers.
3. For pads in the center:
The stencil aperture should be designed into round with area reduced to 50–75 %.

AF50T/ AF51Y

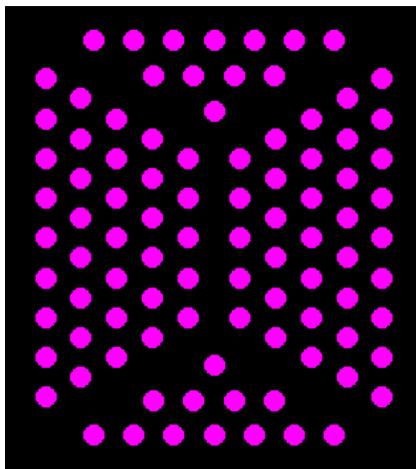

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. For pads on four sides:
The stencil aperture for each pad should be centered with area reduced in a ratio of 1:0.8 or 1:0.9 and the shape should be rectangle with round chamfers.
3. For round pads in the center, the aperture should be opened in the shape illustrated by the bottom figure (pink areas refer to the aperture area) and centered with area reduced to 50–75 %.

AF20/ BG600L-M3

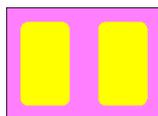

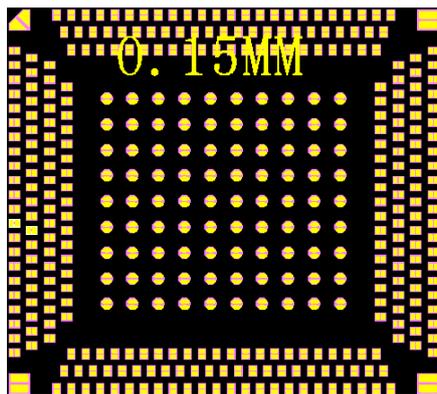

1. The stencil thickness of the area for the module should be partly stepped-up to 0.13–0.15 mm.
2. For pads on four sides:
The stencil aperture for each pad should be centered with area reduced to 75–90 % and the shape should be rectangle with round chamfers.
3. For square pads in the center:
The stencil aperture should be designed into round with area reduced to 50–70 %.

BG77/
BG770A-GL

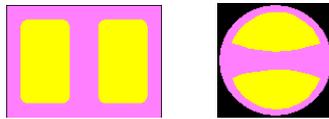

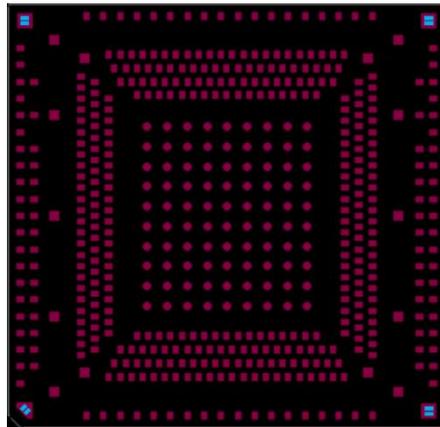

1. The stencil thickness of the area for the module should be partly stepped-up to 0.10–0.13 mm.
2. For the round pads of the module, the stencil aperture should be centered with area reduced in a ratio of 1:0.8 or 1:0.9.

RG500Q/
RG500L/
AG520R/
AG509M-EU/
EG512R-EA

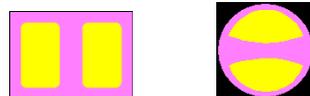

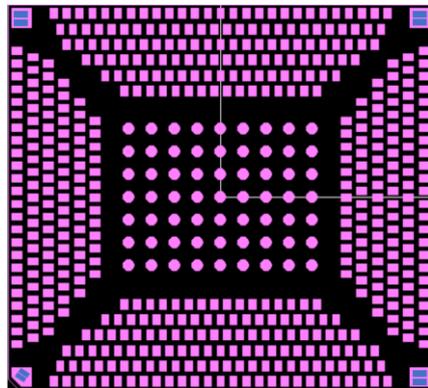

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For each pad on four sides: the aperture of each pad should be centered with area reduced in a ratio of 1:0.7 or 1:0.85, and should be designed with round chamfers as shown by the bottom left figure (yellow areas indicate the apertures for each pad, width of the bridge in between is 0.20 mm).
3. For round pads in the center, the aperture should be in the shape shown by the bottom right figure (yellow areas indicate the aperture area) and centered with area reduced to 50–75 %.
4. The stencil aperture for the four pads at four corners should be centered with area reduced in a ratio of 1:0.7 or 1:0.8 and a 0.3-mm-width bridge should be left in the middle.

AG550Q

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For each pad on four sides: the aperture should be centered with area reduced in a ratio of 1:0.7 or 1:0.85, and should be designed with round chamfers as shown by the bottom left figure (yellow areas indicate the apertures for each pad).
3. For round pads in the center, the aperture should be in the shape illustrated by the bottom right figure (yellow areas refer to the aperture area) and centered with area reduced to 50–75 %.
4. The stencil aperture for the four pads at four corners (shown by the blue blocks) should be centered with area reduced in a ratio of 1:0.7 or 1:0.8 and a 0.3-mm-width bridge should be left in the middle.

SG865W-WF

1. The stencil thickness of the area for the module should be partly stepped-up to 0.15–0.18 mm.
2. For each pad on four sides: the aperture should be centered with area reduced in a ratio of 1:0.7 or 1:0.85, and should be designed with round chamfers as shown by the bottom left figure (yellow areas indicate the apertures for each pad).
3. For round pads in the center, the aperture should be in the shape illustrated by the bottom right figure (yellow areas refer to the aperture area) and centered with area reduced to 50–75 %.
4. The stencil aperture for the four pads at four corners (shown by the blue blocks) should be centered with area reduced in a ratio of 1:0.7 or 1:0.8 and a 0.3-mm-width bridge should be left in the middle.

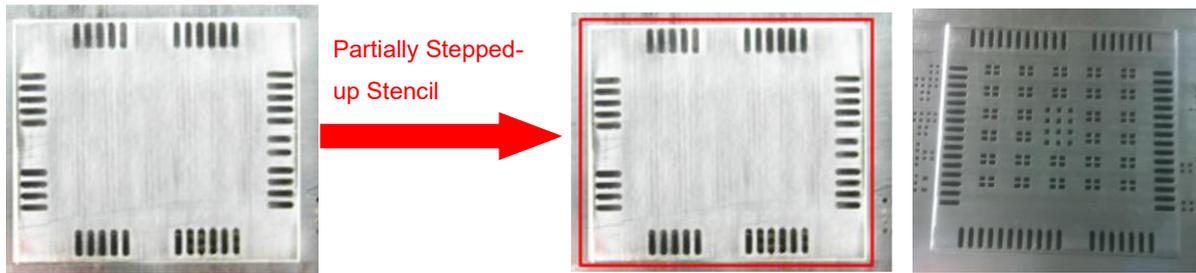

Figure 3: Stepped-up Stencil Area

NOTE

1. Quectel modules listed above may include multiple models. Please refer to the corresponding module specifications for details.
2. It is recommended that no component should be mounted in the area at the backside of the module on PCB, for the convenience of heating and repairing.
3. Please do not design any silkscreen in the area where the module will be mounted to avoid the height that may influence the soldering.
4. Stencil apertures for the components pads within 1.0 mm from the partially thickened area of the stencil should be reduced by 10 % to 30 % compared with regular apertures, since the thickening will increase the volume of solder paste. When there is a need to step-up the stencil, all 0201 components (with package measuring 0.024 in by 0.012 in) and components with 0.40 mm or 0.50 mm pin-pitch should be kept over 3.0 mm away from the stepped-up area to avoid solder bridging and short circuit of components close to the module that is caused by thicker solder paste.
5. Please optimize the stencil design depending on the actual situation.
6. Inward shrinking and outward extending are relative to the host PCB footprint of the module. For details of the recommended footprint, please refer to the hardware designs of corresponding modules.

4.5. Mounting Process

4.5.1. Load Materials

In order to ensure mounting accuracy, for single modules that have been unpacked for baking, it is recommended for the customers to use a dedicated tray/fixture for module loading.

For tape and reel packed modules, there is a need to set the feeding spacing according to actual conditions.

4.5.2. Automatic Placement

Select a suitable nozzle according to the module size. To keep module's stability, please ensure that the nozzle is placed in the center of gravity, image detection and recognition are 100 % passed, and keep a medium speed when mounting the module. After the module is placed onto the motherboard, the module pins should be in alignment with the corresponding solder paste on the motherboard's pads. The triangle mark on the module indicates its first pin, which should correspond to the mark on PCB.

Figure 4: Automatic Placement

Figure 5: First Pin and Mounted Picture

4.6. Reflow Soldering

It is recommended to test the temperature based on real modules. Thermocouple temperature test points should be applied to both pins on four sides and that at the bottom, to guarantee required soldering temperature. Please refer to the recommended ramp-soak-spike thermal profile for lead-free reflow soldering in the following figure.

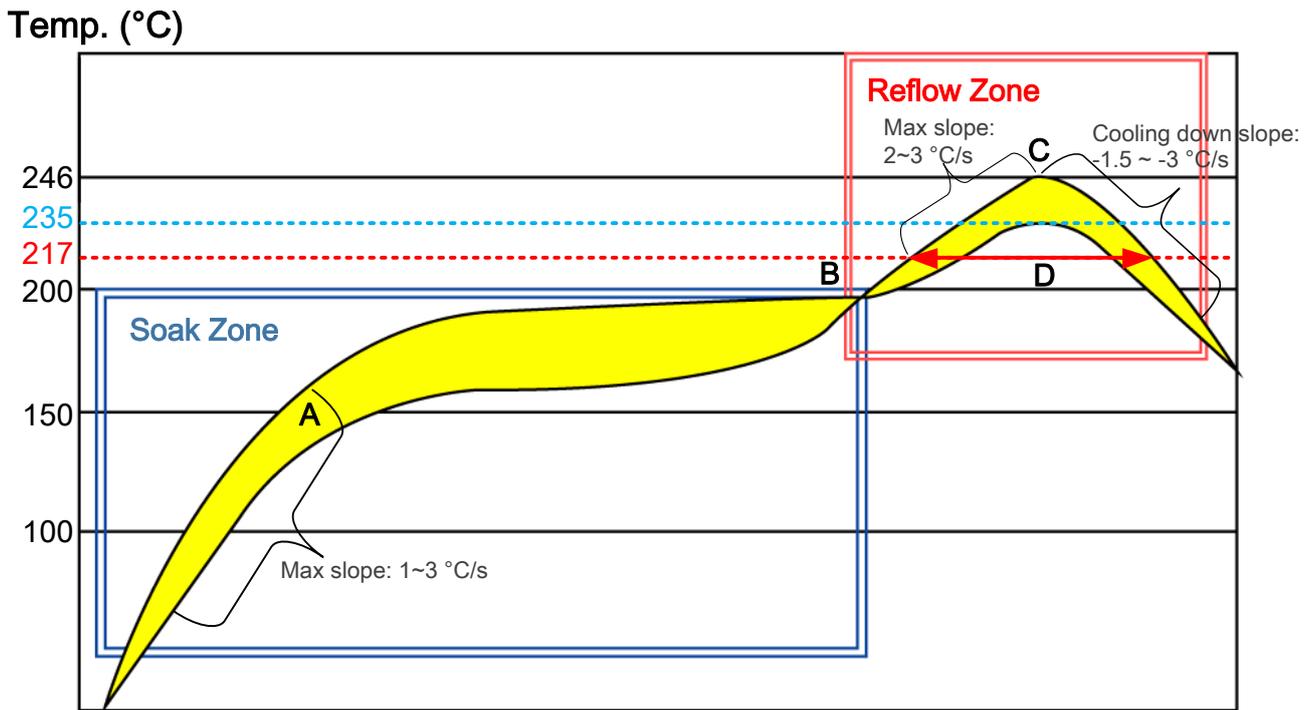

Figure 6: Ramp-soak-spike Reflow Profile

Table 2: Recommended Thermal Profile Parameters

Factor	Recommendation
Soak Zone	
Max slope	1–3 °C/s
Soak time (between A and B: 150 °C and 200 °C)	70–120 s
Reflow Zone	
Max slope	2–3 °C/s
Reflow time (D: over 217°C)	40–70 s

Max temperature	235 °C to 246 °C
Cooling down slope	-1.5 to -3 °C/s
Reflow Cycle	
Max reflow cycle	1

The following aspects should be noticed:

1. Temperature:

The real soldering temperature is affected by factors such as carrier, solder paste, size and thickness of PCB substrate, thermal durability of components, and the PCB design, etc. If the recommended specifications cannot be reached, please contact Quectel technical support, or the module may be damaged during reflow soldering.

2. Carrier:

For motherboard with thickness of less than 1.0 mm, it is recommended to use high Tg material or to use board carrier during reflow soldering, to prevent the motherboard from distorting due to heat.

For 5G modules or modules of 40.0 mm × 40.0 mm or larger size, it is recommended to use carriers, to reduce the defect (such as pseudo soldering or cold joint) rate caused by thermal imbalance resulting from Tg value difference between the module the motherboard.

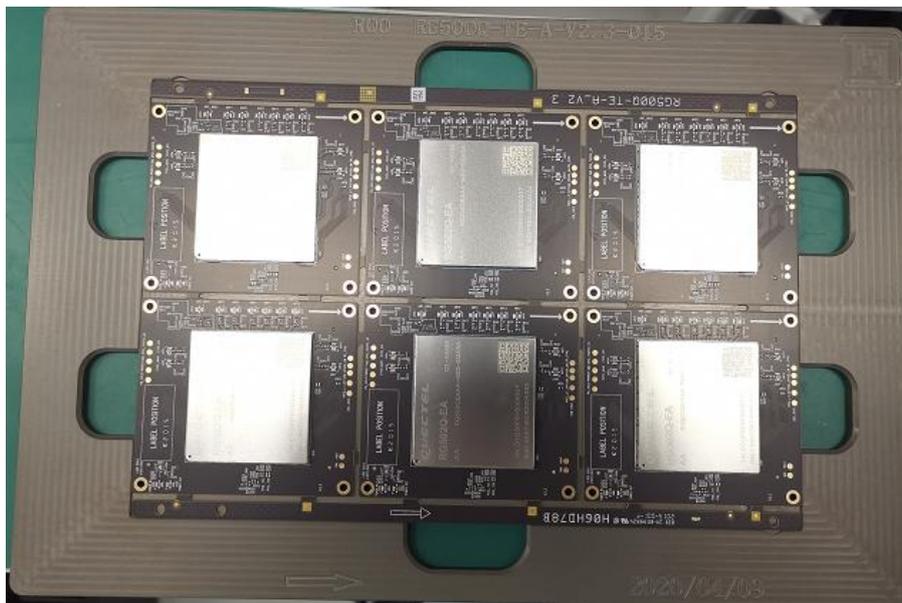

Figure 7: Carrier for 5G Modules

3. Cooling:

By controlling the cooling rate can the soldering defect (fragile solder joint) and negative effects on mechanical stress be avoided. Proper cooling rate will help to make the solder joint lustrous with lower solder fillet. The proper cooling rate should be -3 °C/s.

4. Visual Inspection:

Please implement inspections on the soldering quality with X-ray or other optical methods such as using a magnifier after reflow soldering. For relevant standard, please refer to *IPC-A-610F*, in which 3 classes are proposed. Please perform the inspection following different classes according to practical applications and scenarios. For automotive applications, Class 3 is recommended.

NOTE

1. For modules with paper labels:

- During manufacturing and soldering, or any other processes that may contact the module directly, NEVER wipe the module label with organic solvents, such as acetone, ethyl alcohol, isopropyl alcohol, trichloroethylene, etc. Otherwise, the label information may become unclear.

2. For modules with Cupro-Nickel shields and laser engraved labels:

- During manufacturing and soldering, or any other processes that may contact the module directly, NEVER wipe the module's shielding can with organic solvents, such as acetone, ethyl alcohol, isopropyl alcohol, trichloroethylene, etc. Otherwise, the shielding can may become rusted.
- The shielding can for the module is made of Cupro-Nickel base material. It is tested that after 12 hours' Neutral Salt Spray test, the laser engraved label information on the shielding can is still clearly identifiable and the QR code is still readable, although white rust may be found.

5 Desoldering & Resoldering

5.1. Matters Needing Attention

Please pay attention to the following factors for heating and desoldering:

1. BGA soldering should be inspected through X-ray in advance to avoid bridging and displacement caused by improper temperature or method. It is recommended to contact technical support of the supplier in advance.
2. The motherboard should be baked at 120 °C for 12–24 hours to prevent damp PCBs from being damaged after direct heating. It is important to ensure that all components on the motherboard stand baking at 120 °C.
3. Do not disassemble and desolder the module itself, or the warranty will terminate immediately.

5.2. Desoldering

Please use a heat gun to heat the solder joints from both sides of the motherboard to remove the module. ESD protection must be implemented during the desoldering.

- The temperature of the heat gun should be about 320 °C to 365 °C to release enough heat. The wind speed and distance should be adjusted according to actual situation.
- If the motherboard has been exposed to the air for exceeding 48 hours, then it should be baked before desoldering.
- During heating, the motherboard should be laid flat and fixed to avoid movement, and the distance between the motherboard and the nozzle should be from 2.0–3.5 cm.
- Move the nozzle along the edge of the module at a constant speed. When all of the solder joints are melted, quickly take off the module along the diagonal direction with tweezers and lay it on a flat cooling platform for cooling.

For the module larger than 30.0 mm × 30.0 mm, a BGA rework station or heat gun (with larger outlet nozzle) can be used to desolder components. To prevent separation between pad and circuit as well as PCB blistering caused by long-time heating on a single side, pre-heating is needed at the bottom side of the

module when heat gun is used for desoldering. It is recommended to inspect the soldering quality of modules by X-rays to avoid defects such as BGA bridging and solder skips caused by the maintenance

Figure 8: Resoldering Tools

For single-sided motherboard with no component mounted at the bottom, a preheating station can be used with a heat gun. Heating from both sides helps to melt the solder paste fast and to avoid damage caused by layer separation or blistering.

One of the preheating stations is shown as below. The temperature for reference is 265 °C to 280 °C (provided on the basis of factory experience and the temperature should be set according to real situation)

ANSAI-946C
 微电脑控制加热台
 ELECTRONIC HOT PLATE

Model	ANSAI 946C
Input Voltage	220V±10% AC
Heating Area	200mm*200mm
Power	800W
Temperature	50°C~350°C
Stability	±1.5~°C
Size	218mm*152mm*218mm
Weight	5.4KG

Figure 9: Preheating Station

5.3. Recommended Resoldering Procedure

1. Remove superfluous solder paste on the pads of motherboard with electric soldering iron and keep the pads flat.
2. Pre-apply solder paste on the pads with electric soldering iron, keeping the solder paste moderate in amount and equally distributed.
3. Equally distribute moderate solder flux for the pads.
4. Mount the module precisely on the motherboard (pay attention to the pins and direction of the module). Then, heat the area where the module is mounted on the motherboard from both top and bottom side with heat gun kit or BGA rework station. The resoldering will be finished after solder paste on all pads are melted.
5. After the soldering, cool the motherboard fast with fan.
6. After the temperature returns to normal, inspect the soldering quality for LCC pins on four sides of the module to ensure that there is no defect such as bridging or insufficient solder paste.

Figure 10: Quality Inspection for LCC Pins

7. Finally, inspect the soldering quality of BGA components and pins of the module at the bottom of modules with X-ray.

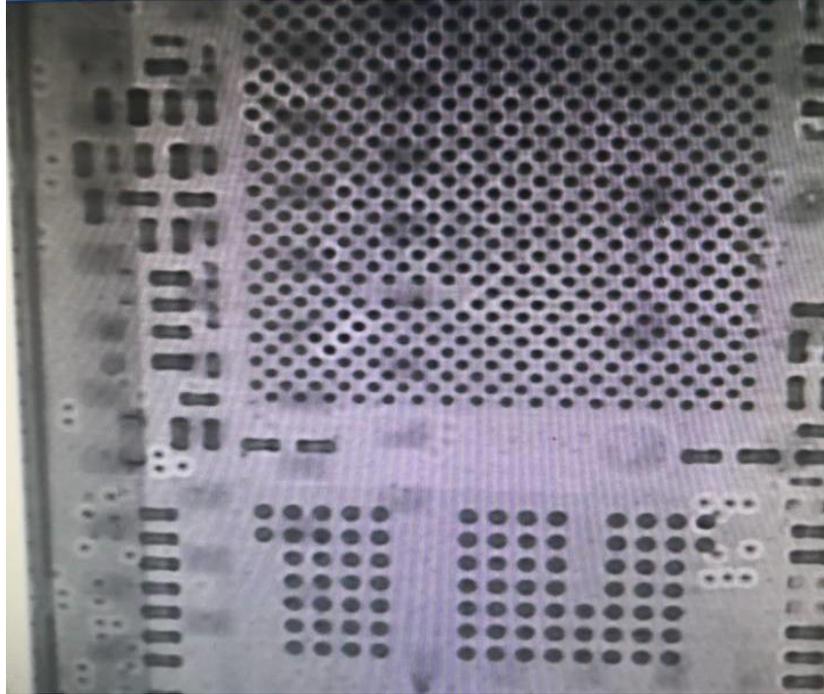

Figure 11: Quality Inspection for LGA Pins or BGA Components

6 ESD Protection

Static electricity may cause intermittent or permanent circuit damage, which is extremely harmful to electronic devices. Most of the damages, as analyzed, are obvious ESD or EOS burning, as shown in the following figure:

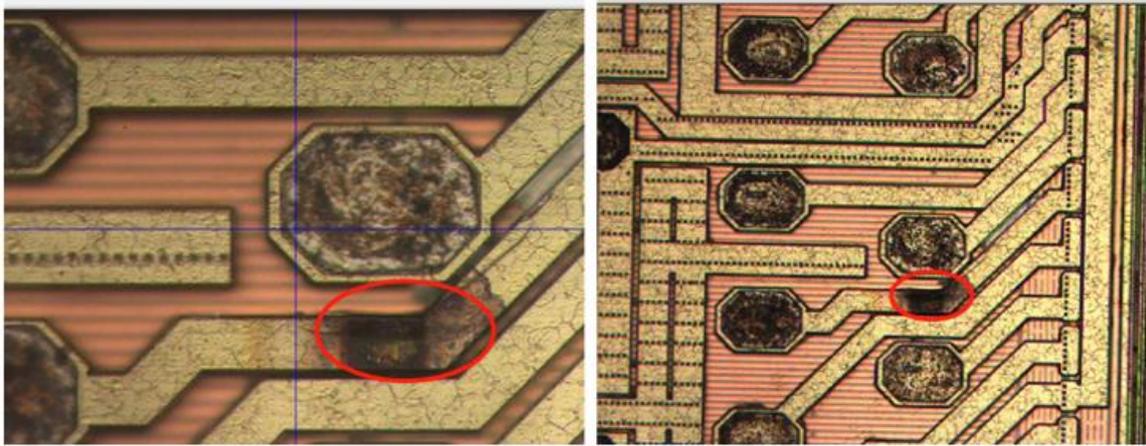

Figure 12: ESD or EOS Burning

Thus, ESD protection is vital to the modules. Please strictly observe the following conditions during production and transportation:

- Avoid touching the module with bare hand, especially for the area of module pins.
- Ground the housing of related equipment such as chip mounters, work bench, soldering equipment.
- ESD protection methods such as anti-static wrist band with grounding wire (cordless anti-static wrist strap is not allowed, while anti-static gloves are recommended) should be adopted for operators.
- Qualified anti-static materials must be used for packaging and PCBA boards.

7 Cautions for Production Process

Avoid using ultrasonic technology for module cleaning since it can damage crystals inside the module.

Due to the complexity of the SMT process, please contact Quectel Technical Supports in advance in case of any special process or any situation that you are not sure about.

8 Appendix Reference

Table 3: Terms and Abbreviations

Abbreviation	Description
BGA	Ball Grid Array
ENEG	Electroless Nickel Electroless Gold
